Cojo bay, CA
AVIRIS-NG (05/11/22)
RGB (2000-552-432nm)

Leaf traits affect leaf optical properties, allowing us to estimate leaf traits from remote measurements of reflectance (“imaging spectroscopy”).

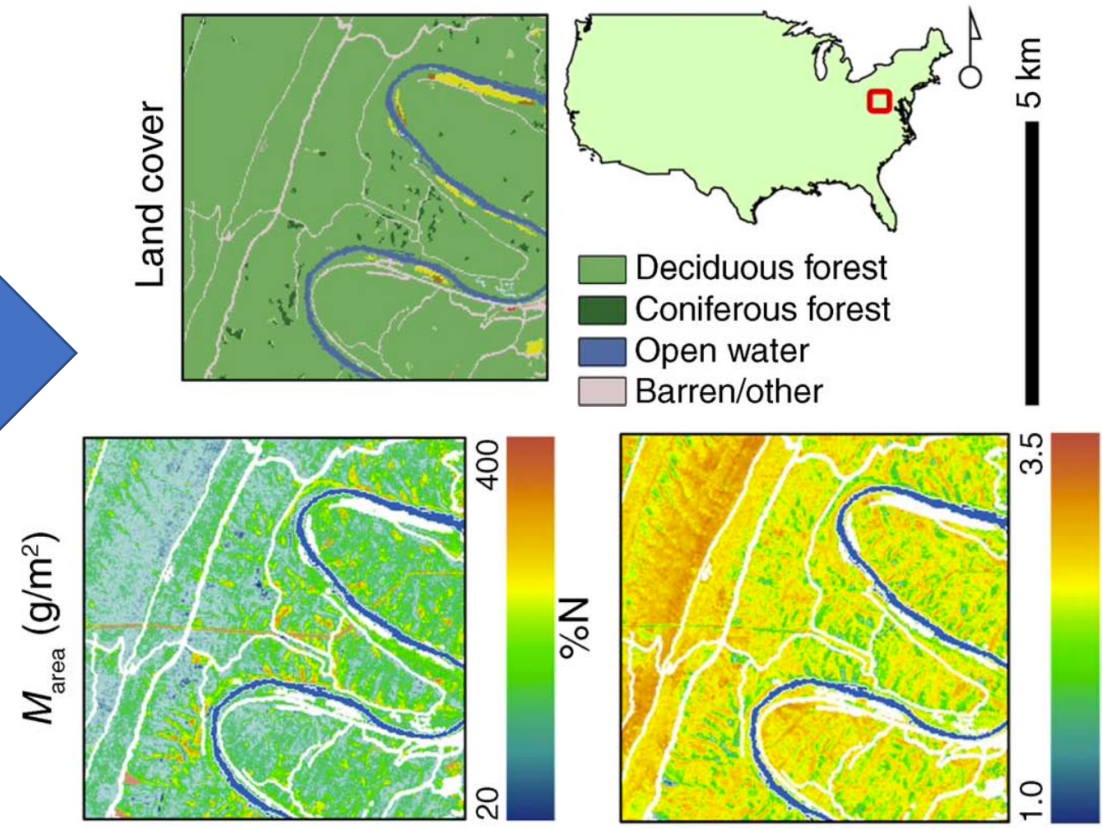

Optical properties of specific traits

Leaf reflectance

Trait retrieval algorithm

Singh et al. 2015 *Ecological Applications*

~~(1) What are the "best" algorithms, at both leaf and canopy scales?~~

"Boring! Make new algorithms!"
- NASA review panel

Fine, we'll make new algorithms!
- Shiklomanov et al.

(2) Why do these algorithms succeed (or fail), and under what conditions?

~~(3) How should we measure spectra to get the best trait estimates?~~

"Too late -- nobody cares!"
- NASA review panel

Fine, we'll look at flowers instead!
- Shiklomanov et al.

New algorithms: Bayesian alternative to PLSR

Traditional approach:

Partial Least Squares Regression (PLSR)

$$trait = \beta_1 PLSR_1 + \dots + \beta_p PLSR_p$$

$$w_1^1 x_{400} + \dots + w_{2400}^1 x_{2400}$$

$$w_1^p x_{400} + \dots + w_{2400}^p x_{2400}$$

Alternative approach:

Bayesian Regression

$$trait \sim N(\theta, \sigma)$$
$$\theta = \beta_0 + \beta_1 x_{400} + \dots + \beta_{2001} x_{2400}$$
$$\beta_i \sim horseshoe()$$
$$\sigma \sim halfCauchy(0, \alpha)$$

Comparable performance to PLSR for estimating leaf %N (and other traits) from field spectroscopy.

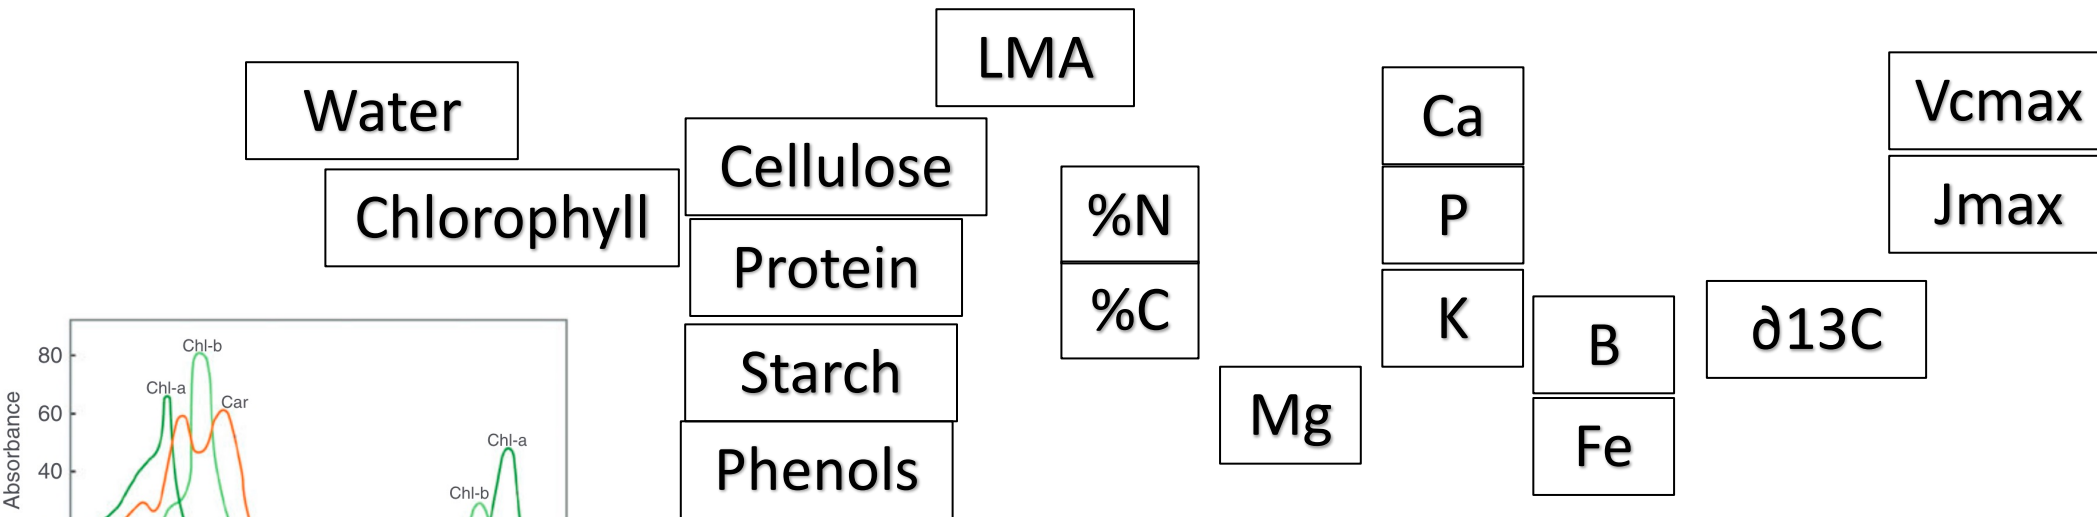

Additional advantages

- Propagate uncertainty
- Leverage prior information
- Conceptually simple
- Extensible (e.g., multivariate)

Why do these algorithms succeed (or fail), and under what conditions?

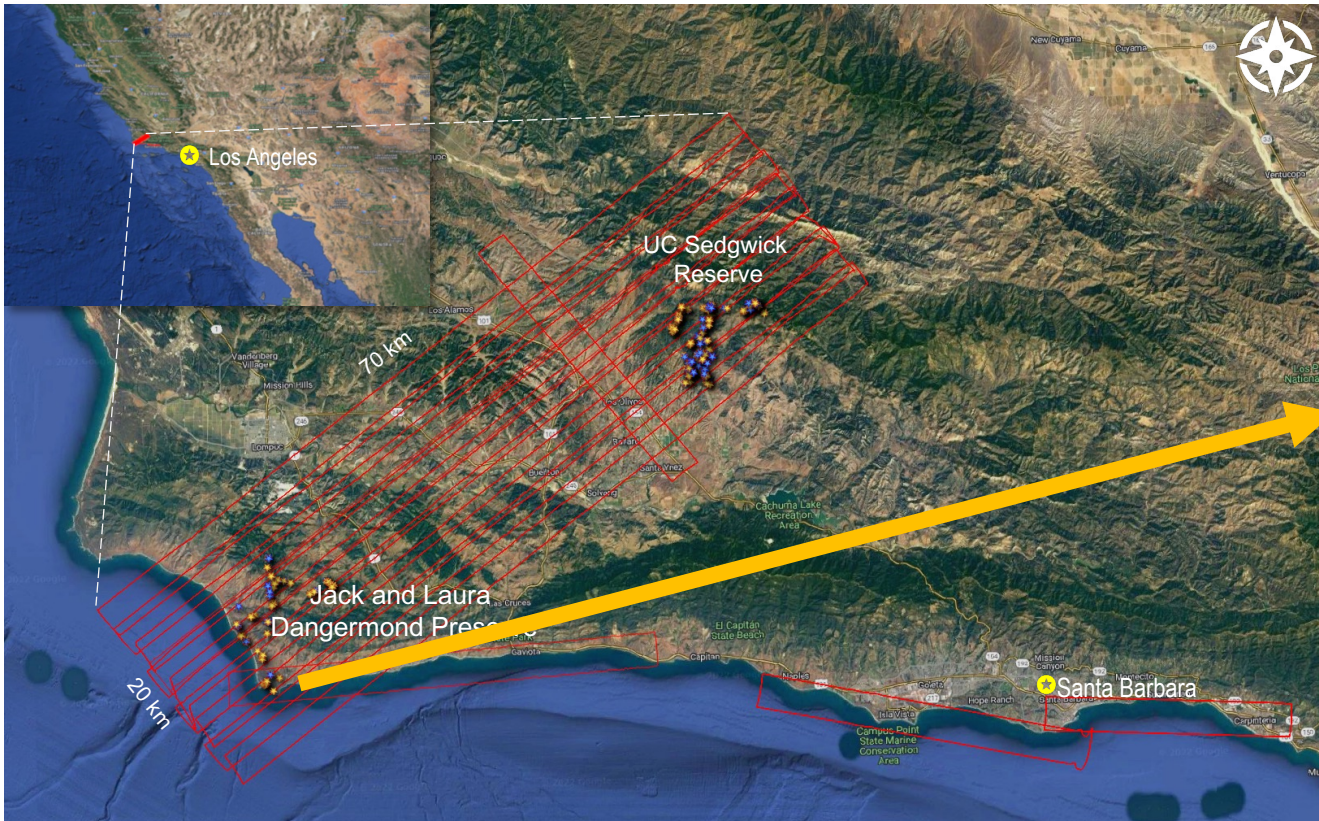

“Visible” ← Clear physical basis → “Invisible”
No direct physical basis

All these traits have been successfully mapped using imaging spectroscopy. **Why does this work? What are we *really* seeing** when we see “invisible” traits, in terms of correlations with other traits, structure, etc.

(3) Flowers!

Dr. Yoseline Angel

SBG High-Frequency Time series (SHIFT) — Weekly AVIRIS-NG flights during spring/summer 2021, with coordinated field sampling.

Mapping flowers and their phenology

Mapping flowers using Gaussian mixture model (GMM)

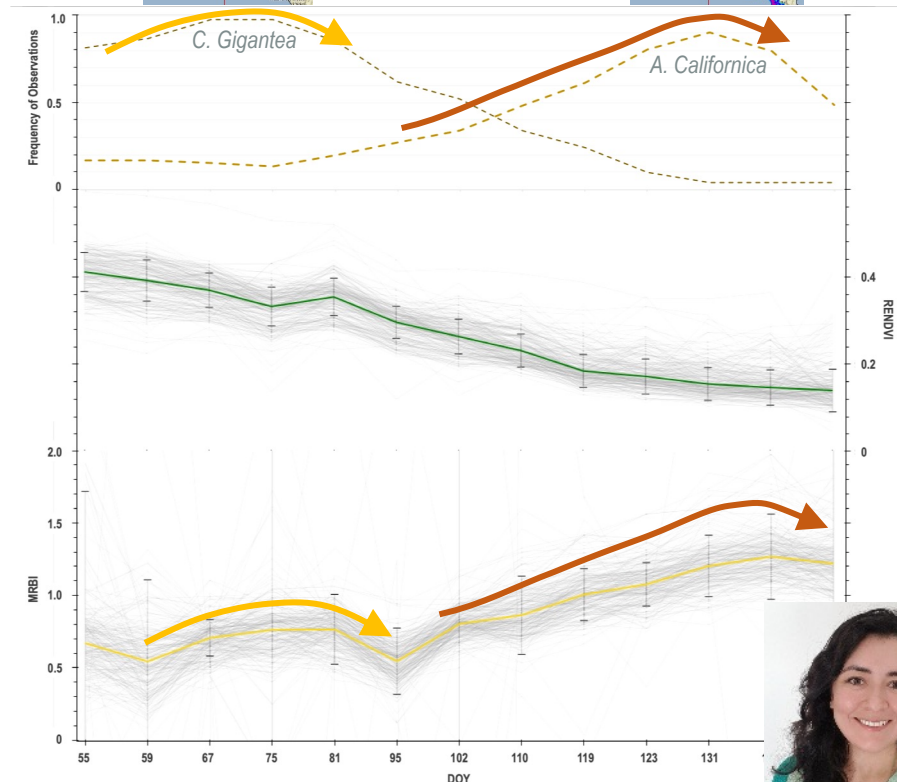

Probability of Occurrence

Spectral clusters
 $p(\theta)$ maps + uncertainties

Certainty

Species reported by **Wildflower Search*** shows the phenological dynamics of *C. Gigantea* and *A. Californica*, observed during their flowering phase

Red-edge normalized difference vegetation index

(Gitelson & Merzlyak, 1994)

$$RENDVI = \frac{R_{750} - R_{705}}{R_{750} + R_{705}}$$

Mixture residual blooming index

$$MRBI = \frac{\bar{R}_{557}}{\bar{R}_{672}} + \frac{\bar{R}_{1209} + \bar{R}_{1108}}{(\bar{R}_{1209} - \bar{R}_{1108})}$$

Reading in Data

Data can be read in using two function calls: `read` and `read_chunked`. The `read` method will pull all the data in the dataset into memory. It is highly recommended to use the `read_chunked` method unless you are sure your data can fit into memory.

```
data = cat.aviris_v1_gridded.read_chunked()
data
```

xarray.Dataset

– Dimensions: (time: 13, y: 12023, wavelength: 425, x: 13739)

▼ Coordinates:

Spectra Selection

```
# Create the RGB image plot
rgb_image = ds_rgb.hvplot.rgb(
    x='x', y='y', bands='wavelength', aspect = 'equal', frame_width=400).opts(
    tools=["hover", 'lasso_select'])

# Create streams
posxy = hv.streams.PointerXY(source=rgb_image, x=730302.5, y=-3819657.5)
sel = hv.streams.Lasso(source=rgb_image, geometry=np.array([[730302.5, 3819657.5]]))

# Function to build a new spectral plot based on mouse hover positional
# Information retrieved from the RGB image using our full reflectance dataset
def point_spectra(x,y):
    return aoi.sel(x=x,y=y,method='nearest').hvplot.line(
        y='reflectance',x='wavelength', color='#1b9e77', frame_width=400)

def selected_info(geometry):
    x = find_nearest(aoi.x, geometry[:, 0])
    y = find_nearest(aoi.y, geometry[:, 1])
    points = set(list(zip(x, y)))

    list_of_lines = [aoi.sel(x=x, y=y, method='nearest').hvplot.line(
        y='reflectance',x='wavelength', frame_width=400) for x, y in points]
    return hv.Overlay(list_of_lines)

# Define the Dynamic Maps
point_dmap = hv.DynamicMap(point_spectra, streams=[posxy])
lasso_dmap = hv.DynamicMap(selected_info, streams=[sel])

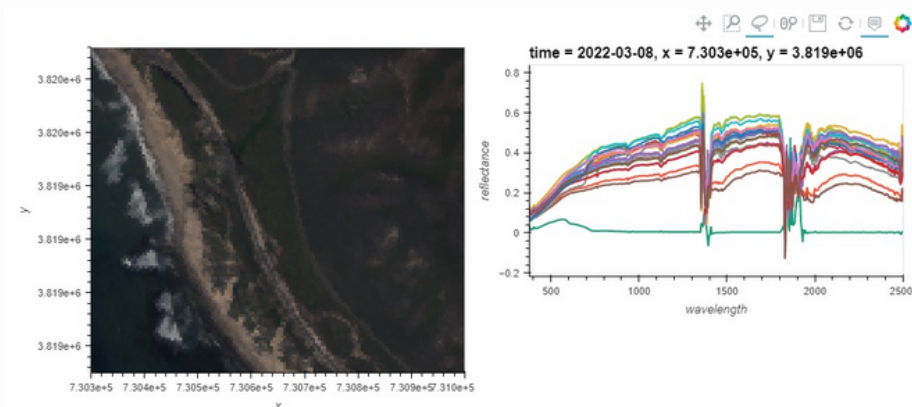

# Plot the RGB image and Dynamic Maps side by side
(rgb_image + point_dmap*lasso_dmap)
```
