Vegetation structure

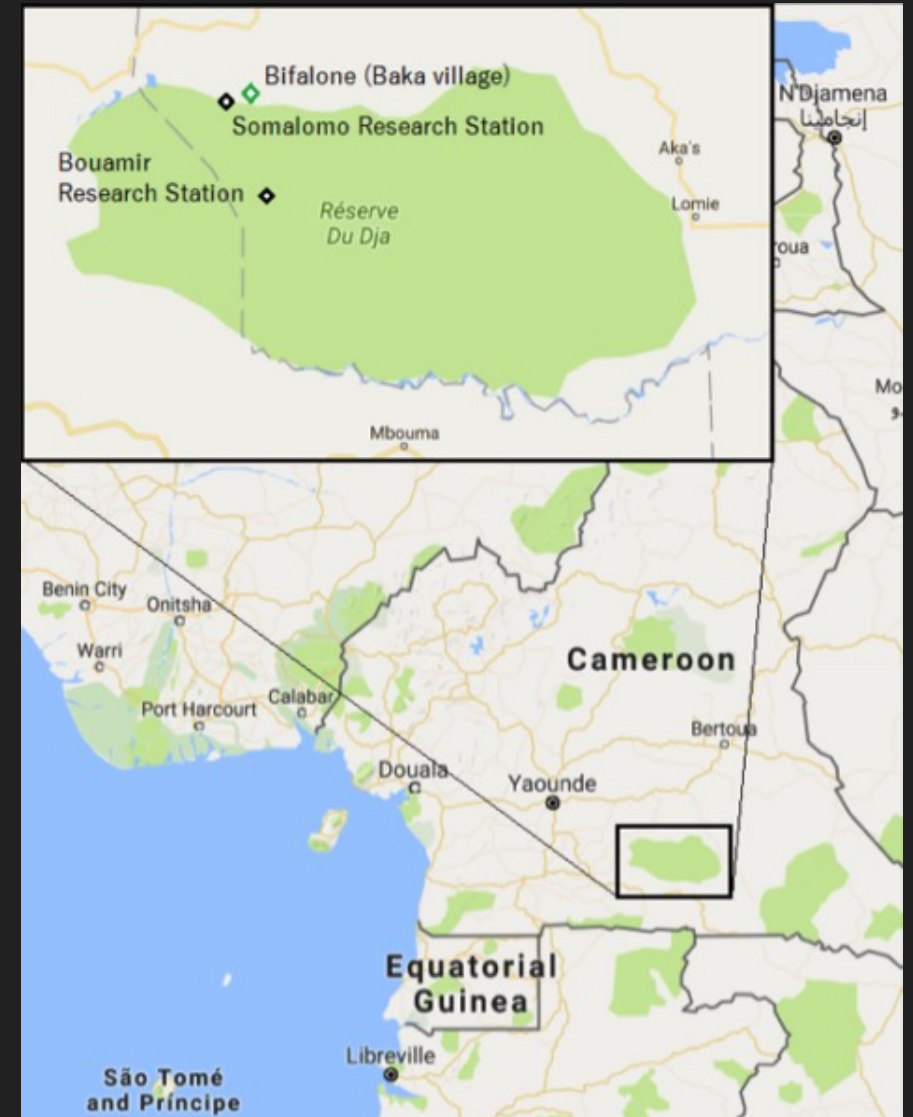

Ecosystem  
functioning

# Questions

1. How do movements of seed-dispersing animals (birds, bats, primates, and antelopes) vary with 3D forest structure at local and landscape scales?
2. How are habitat selection and movements of different seed-dispersers influenced by vegetation functional diversity and phenology?
3. How do forest fragmentation and other anthropogenic disturbances influence animal movements and patterns of seed dispersal?

# Dja Faunal Reserve, Cameroon

- Cameroon's largest protected area (526 km<sup>2</sup>)
- Mature tropical lowland rainforest
- At least 312 tree species, ~90% are dispersed by vertebrates

# Habitat characterization

## Forest Structure

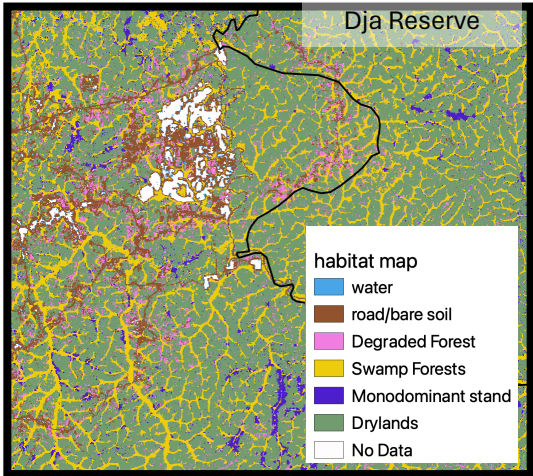

Local-scale 3D maps  
 Sensor: **drone LiDAR**  
 Point density: >100 pt/m<sup>2</sup>

Regional-scale maps  
 Sensor: **GEDI, Landsat 8, PALSAR, Copernicus DEM**  
 Spatial Resolution: 25m-100m

## Land Cover

Local and Regional-scale maps  
 Sensor: **Sentinel-2**  
 Spatial Resolution: 10m

Ploton et al, (in preparation)

## Phenology

Local-scale maps  
 Sensor: **drone RGB**  
 Spatial Resolution: 0.3m  
 temporal resolution: monthly

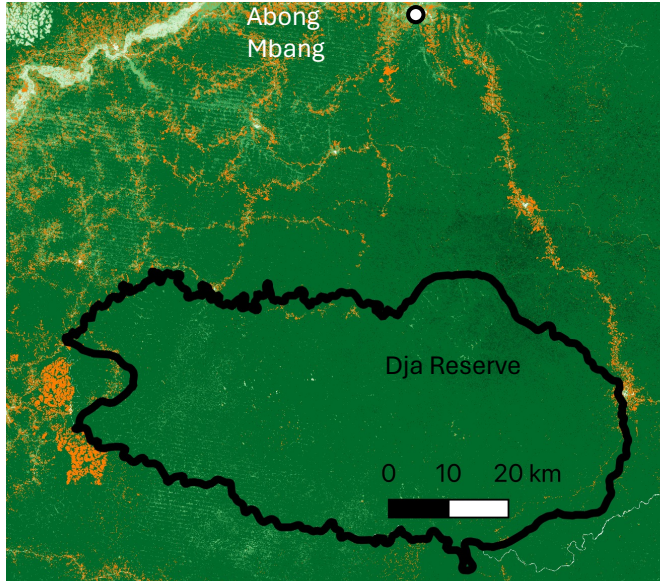

Regional-scale maps  
 Sensor: **PlanetScope**  
 Spatial Resolution: 3m  
 temporal resolution: daily\*

Biswas et al. (in preparation)

## Degradation/Deforestation

Regional-scale maps  
 RADD, GFC, TMF  
 Sensor: **Sentinel-1, Landsat**  
 Spatial Resolution: 10m, 30m  
 temporal resolution: 6-12 days, annual

Tree cover 0% 100% Degradation/Deforestation

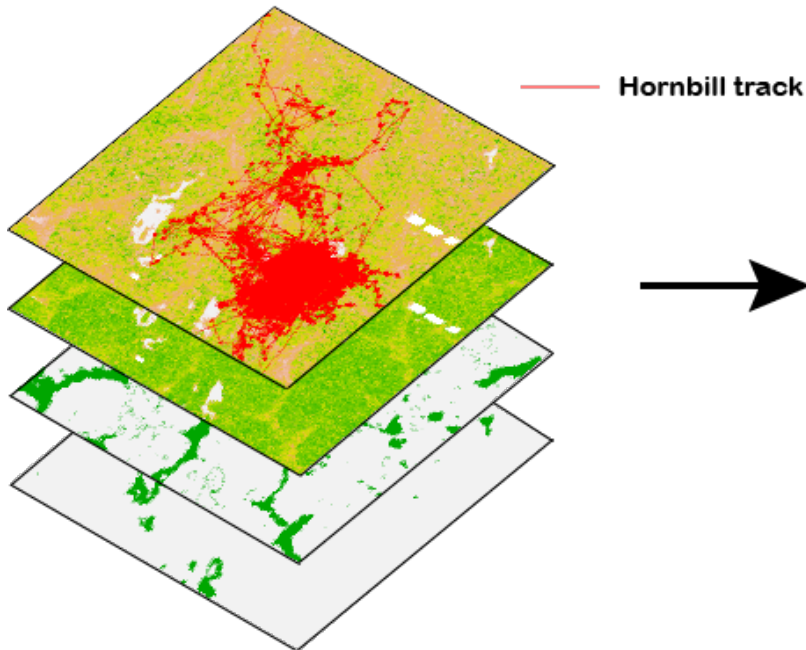

# Animal tracking

- 25 birds tracked since April 2022
  - 16 black-casqued hornbill
  - 5 white-thighed hornbill
  - 4 great blue turaco
- 10 hammer-headed fruit bats
- Antelope dung piles and beds
- 6 years of primate survey data

# Q-1 How do movements of birds, bats, primates, and antelopes vary with 3D forest structure at local and landscape scales?

Quantify animal habitat selection

Simulate animal movements following fruiting tree visit

Predict spatial patterns of seed dispersal based on gut passage time

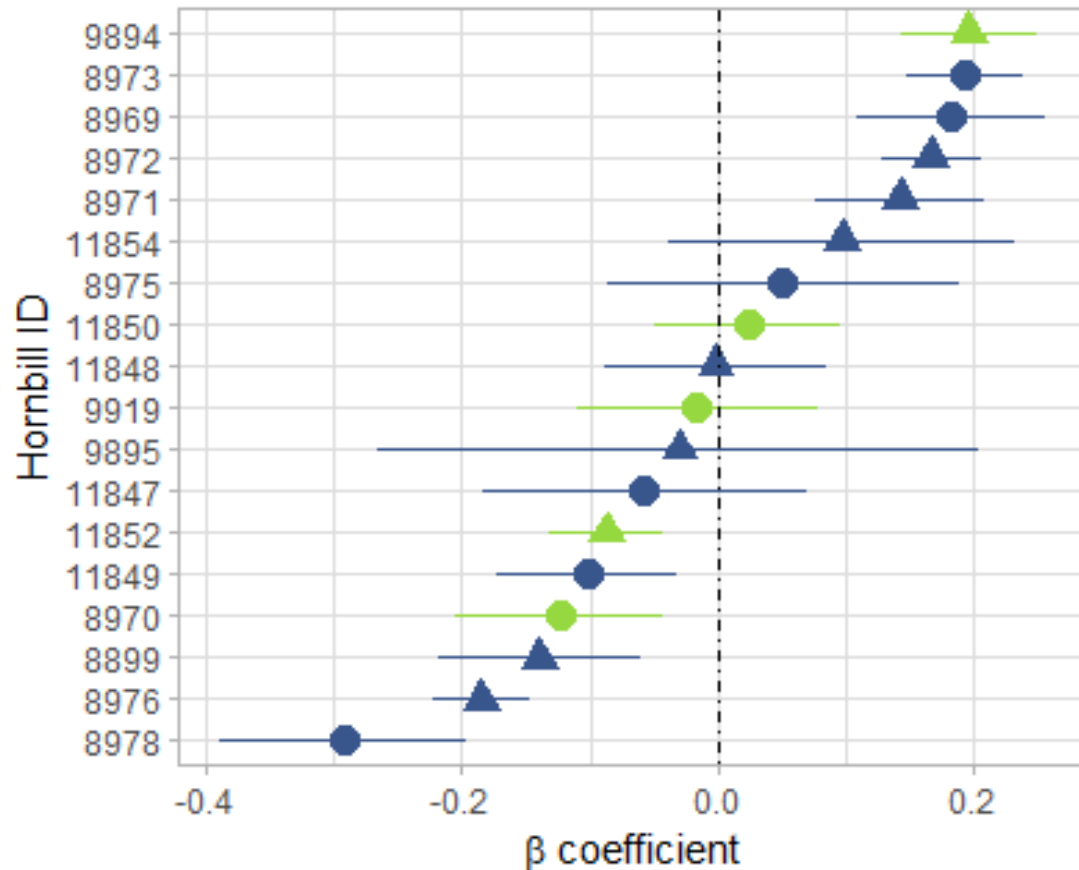

# Individual hornbills vary in response to canopy gaps

Species ● BCH ● WTH      Sex ● Female ▲ Male

Distance to Small Canopy Gaps (50 m<sup>2</sup>)

Distance to Large Canopy Gaps (500 m<sup>2</sup>)

# Seed shadow produced by black-casqued hornbills

● *Maesopsis eminii*

**Black-casqued hornbill** - - - -

Canopy Height: 0.253 (0.018)\*\*\*

Vertical Complexity Index: 0.337 (0.148)\*

**White-thighed hornbill**

Canopy Height: 0.339 (0.042)\*\*\*

Vertical Complexity Index: 1.641 (0.143)\*\*\*

**Great blue turaco**

Canopy Height: 0.217 (0.099)\*

Distance to large gaps: -0.192 (0.093)\*

**Hammer-headed bat**

Canopy Height<sup>2</sup> -0.248 (0.041)\*\*\*

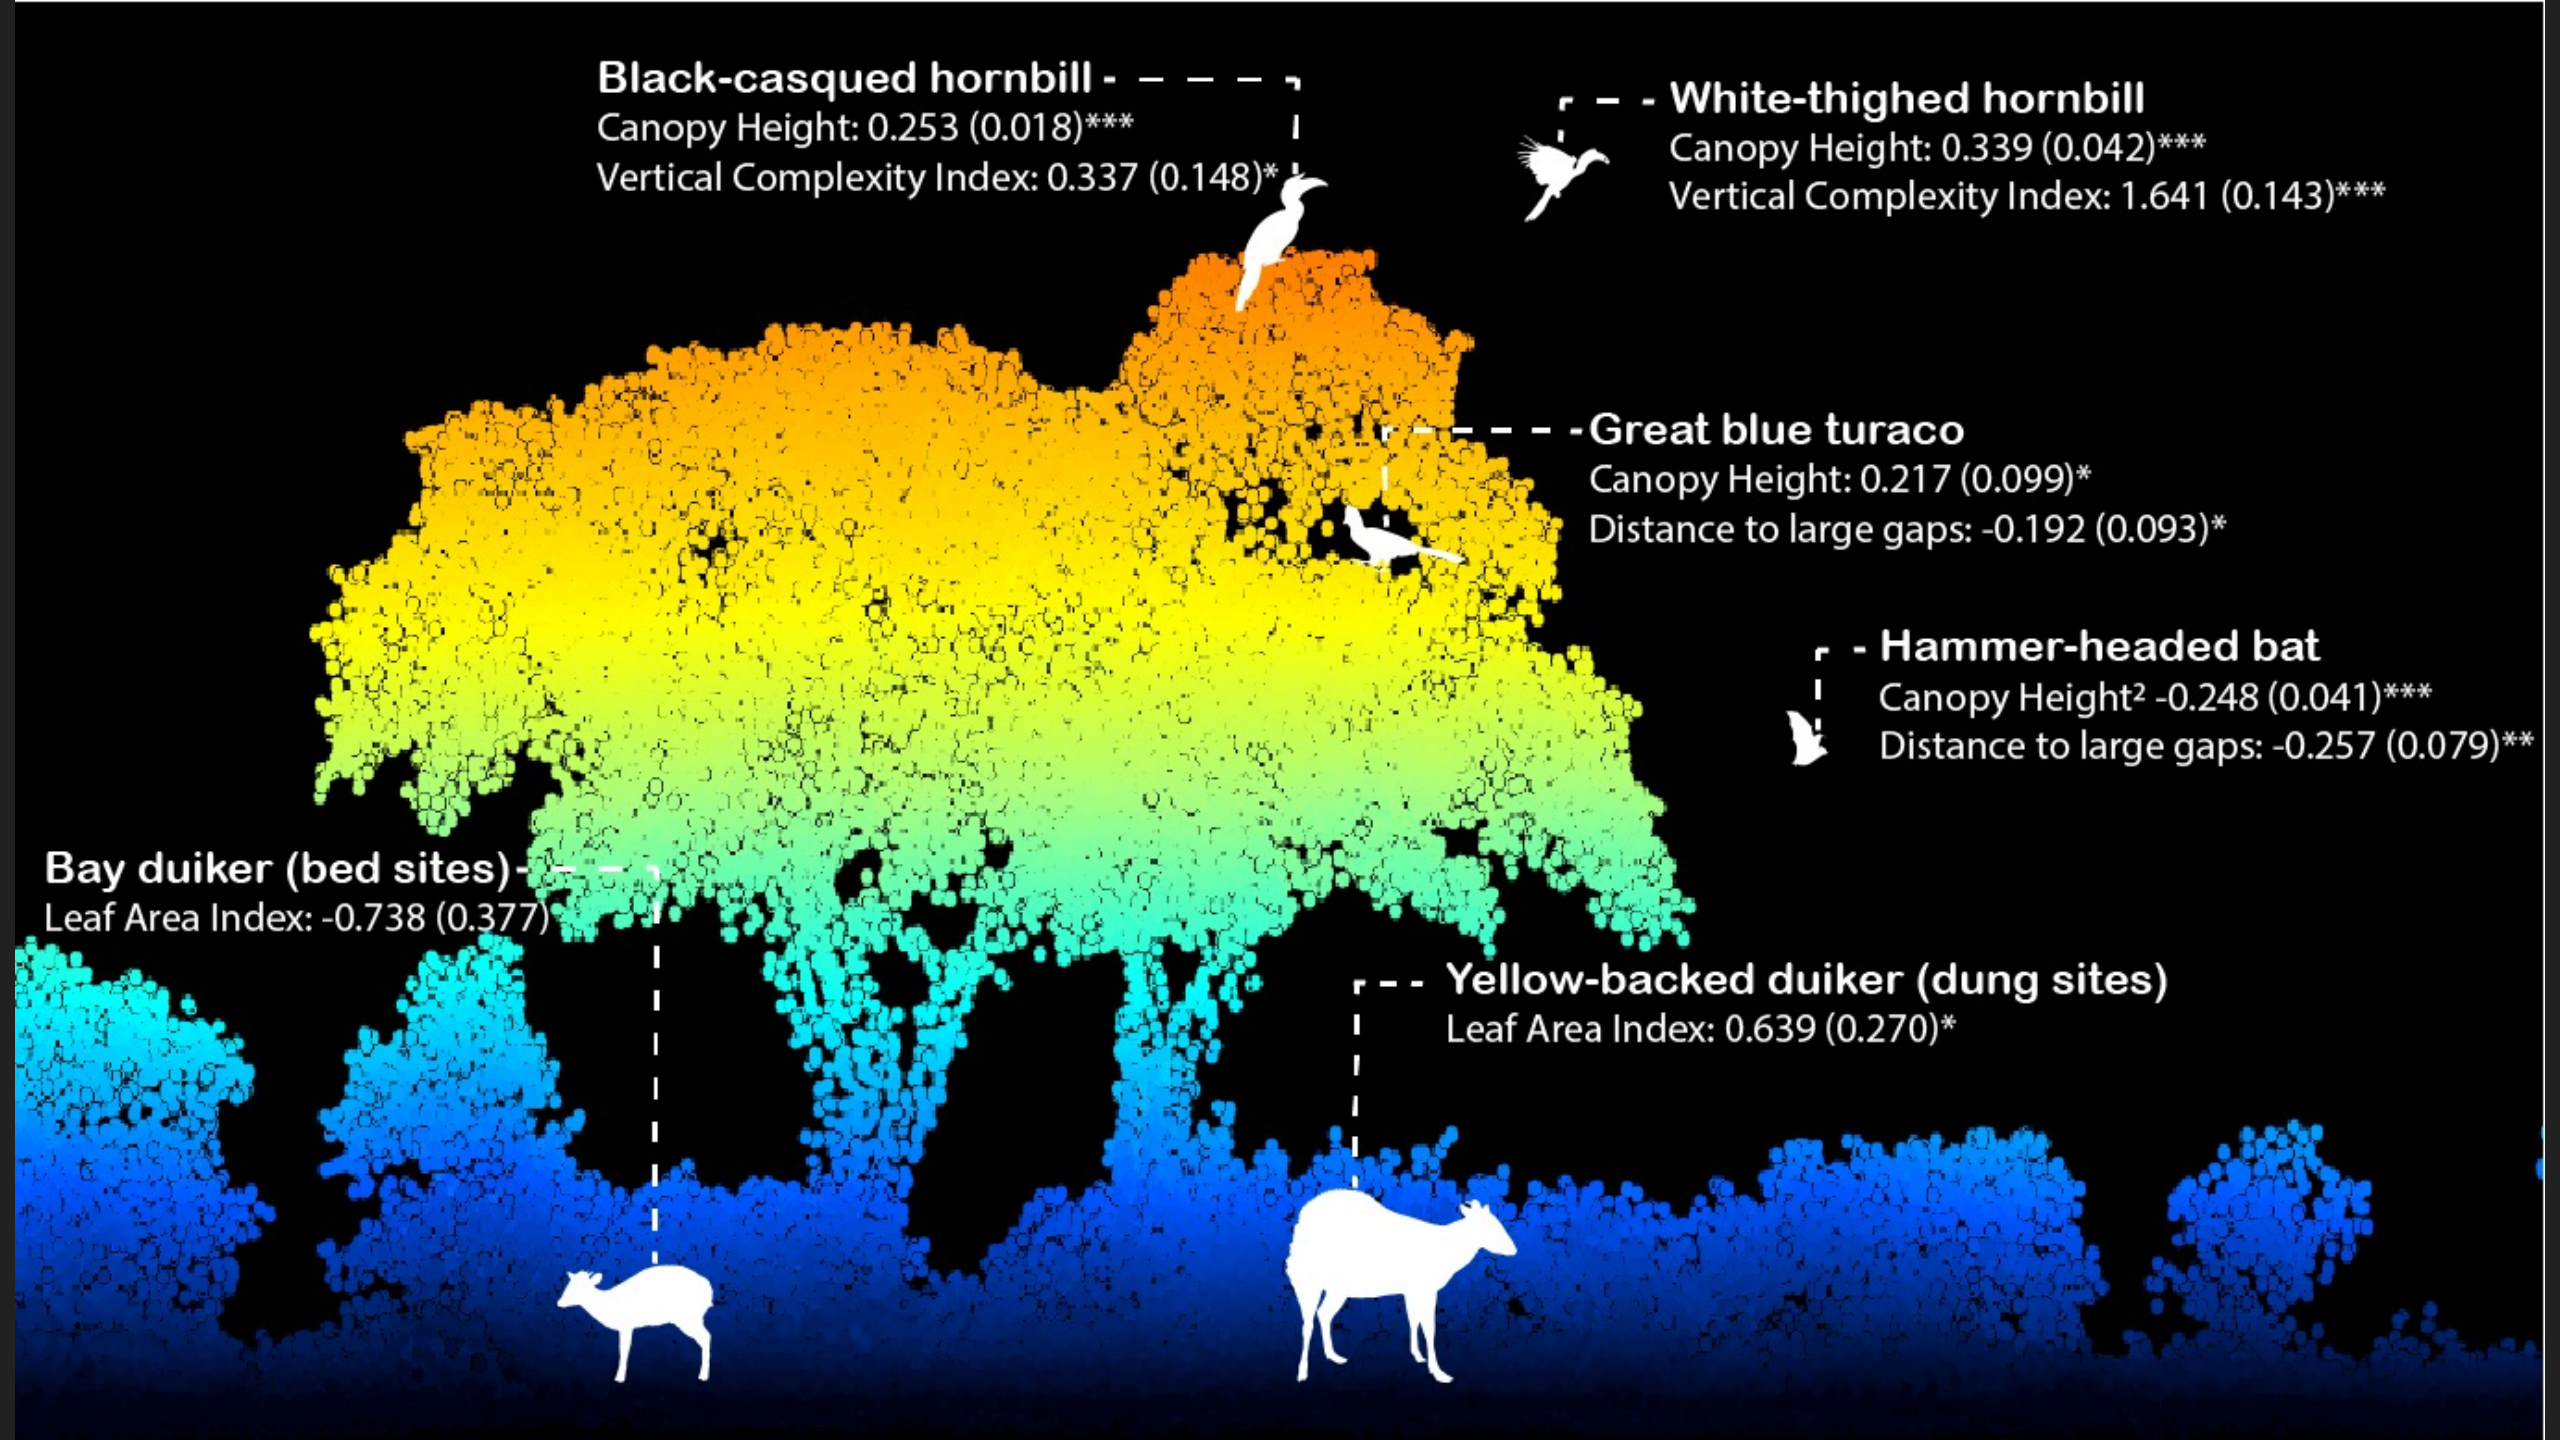

Distance to large gaps: -0.257 (0.079)\*\*

**Bay duiker (bed sites)** - - - -

Leaf Area Index: -0.738 (0.377)

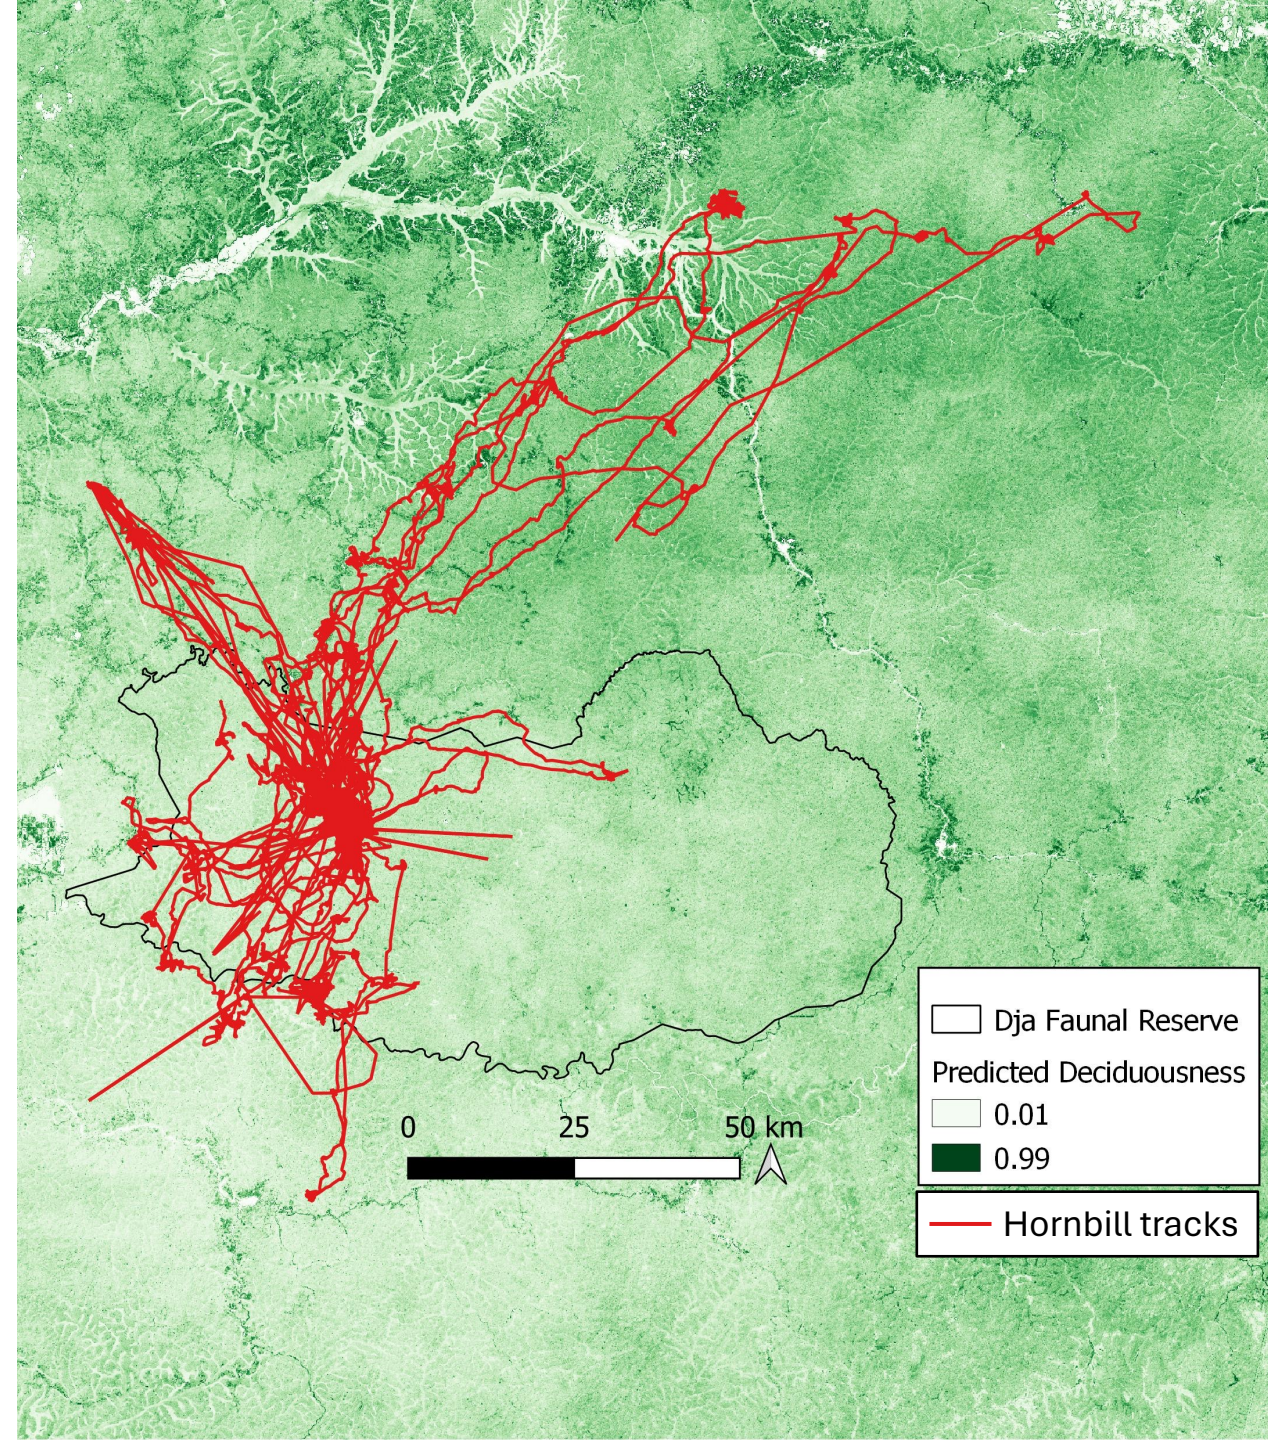

**Yellow-backed duiker (dung sites)**

Leaf Area Index: 0.639 (0.270)\*

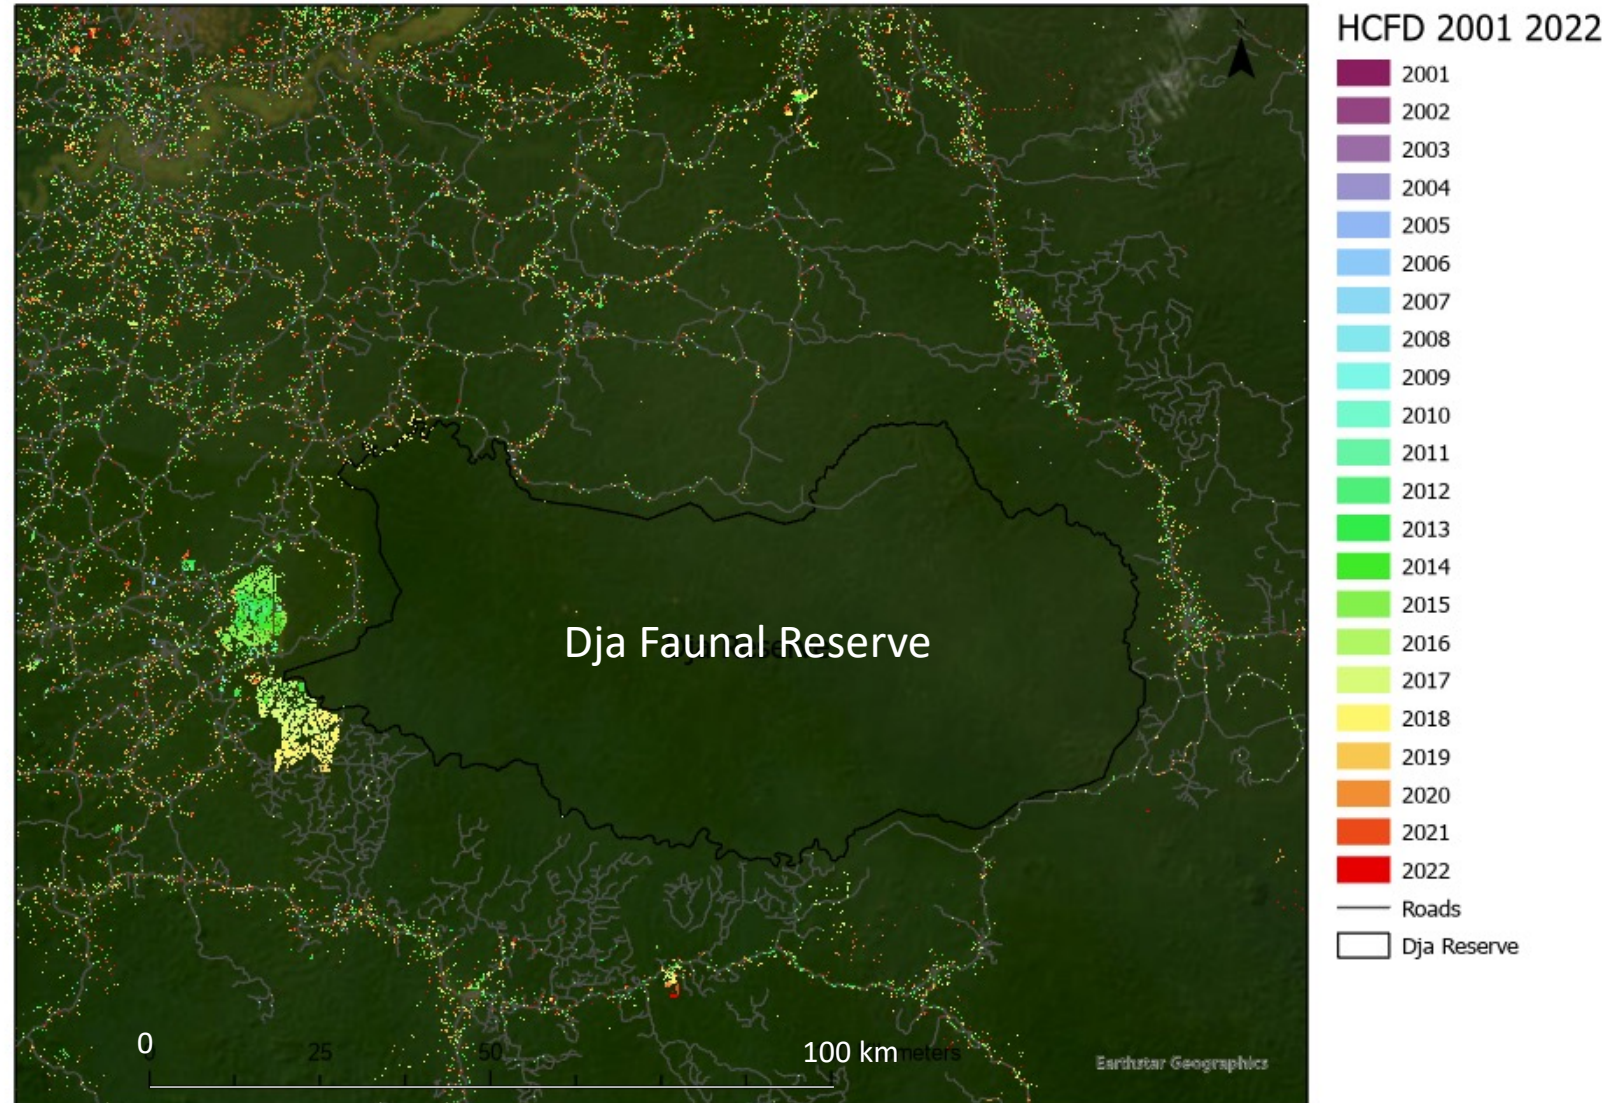

## Q-2 How are habitat selection and movements of different seed-dispersers influenced by vegetation functional diversity and phenology?

- Mapped probability of deciduous tree occurrence using Sentinel-2
- Detected flowering, leaf-flush events, upscaled using Planet data
- Related hornbill movements to ground-truthed fruiting trees

# Q-3 How do forest fragmentation and other anthropogenic disturbances influence animal movements and patterns of seed dispersal?

- Large-scale forest disturbances from commercial plantations
- Small-scale disturbances from smallholder agriculture

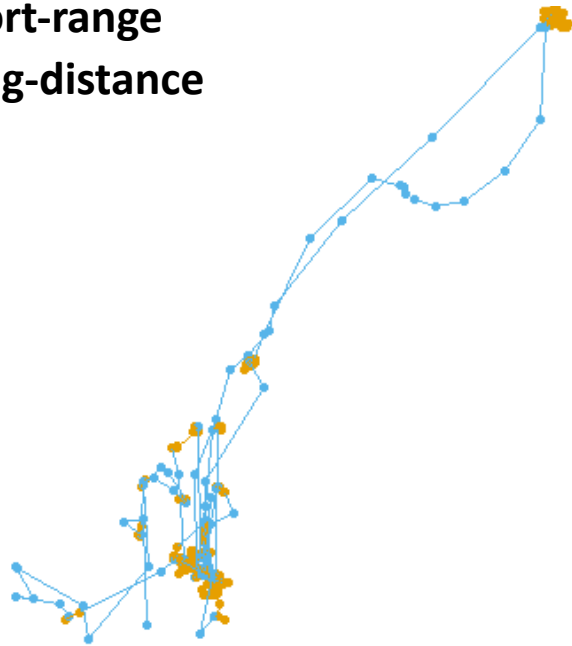

# Upscaled lidar metrics using GEDI

- Upscaled using:
  - Landsat 8
  - ALOS/PALSAR
  - Copernicus DEM
- Validated canopy height estimates with GEDI
- Related upscaled canopy height to hornbill movements

# Contrasting habitat selection for short- and long-distance movements

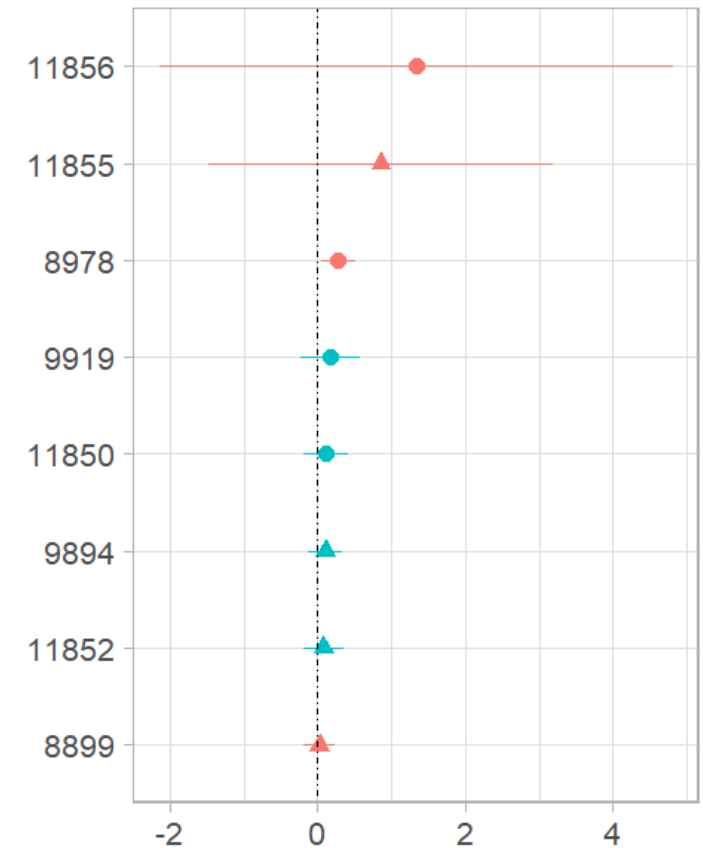

— Short-range  
— Long-distance

**A) Short-range**

**B) Long-distance**

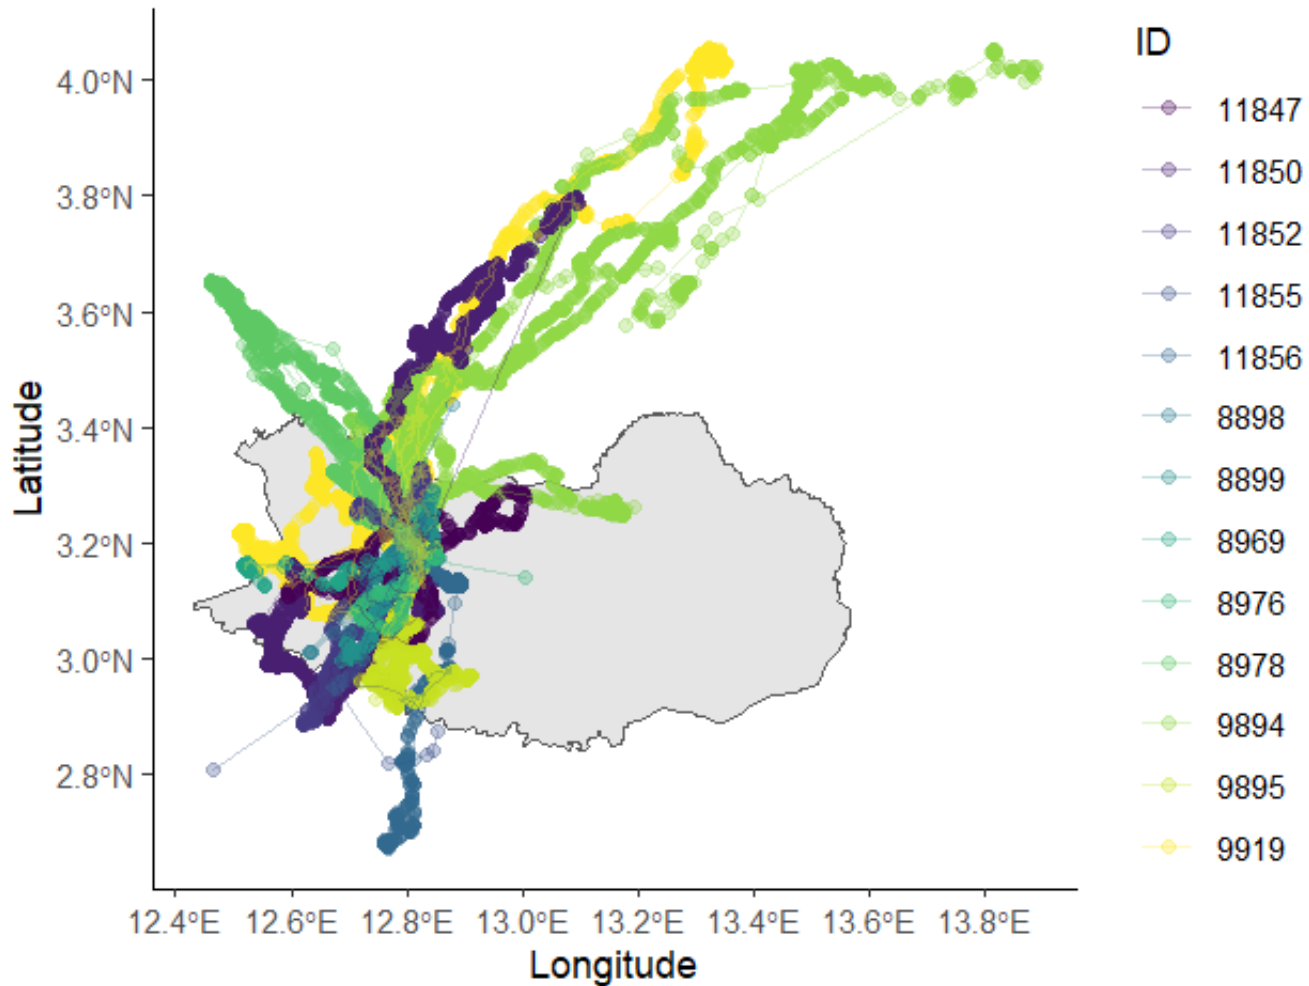

**Selection for Canopy Height (30 m)**

Species ◆ BCH ◆ WTH Sex ◆ Female ▲ Male

# Diversity of hornbill movements

## Northern vs. southern flyway

## Back-and-forth movements

# Summary

- Evidence for feedback between vegetation structure and seed dispersal by animals
- 3D vegetation structure is important for seed dispersers that move throughout all vegetation strata
- Movement diversity can increase the diversity of seed dispersal services available to rainforest trees

Thank you
