

Surface Biology and Geology, ECOSTRESS, and EMIT

A satellite image showing a coastal region with a large river delta. The water is a mix of light blue and green, indicating varying depths and possibly sediment or phytoplankton concentrations. The land is a mix of green and brown, with a network of roads and rivers visible. The overall scene is a complex of natural and human-made features.

SDSC Meeting, 2024

What is the Surface Biology and Geology Mission?

What is the Surface Biology and Geology Mission?

SBG-TIR - US Instrument, Italian sensor, spacecraft, launch and science
SBG-VSWIR - US Flight Project

VSWIR

185 km swath
10 nm spectral sampling
30 m GSD
16 day revisit

TIR

935 km swath
8 MIR and TIR channels
60 m GSD
3 day revisit

TIR-VNIR (Italy)

Boresited with TIR
30-60 m GSD
2-3 channels

SBG will meet Decadal Survey priority objectives to enable transformative science & applications

Subhead

Ecosystems & Natural Resources

E-1. What are the structure, function, and biodiversity of Earth's ecosystems? (7 observables)

Conservation and Biodiversity

E-2. What are the fluxes between ecosystems and the atmosphere, the ocean, and the solid Earth, and how and why are they changing? (1 observable)

Conservation and Biodiversity

E-3. What are the fluxes (of carbon, water, nutrients, and energy) within ecosystems? (2 observables)

Coral Reef Ecosystems

Solid Earth

S-1. How can large-scale geological hazards be accurately forecast? (5 observables)

S-2. How do geological disasters directly impact the earth system? (3 observables)

Strategic Mineral Resource Mapping

Hydrology

H-1. How is the water cycle changing? (3 observables)*

Global Food Security

H-2. How do anthropogenic changes in climate, land use, water use, and water storage, interact and modify the water and energy cycles? (4 observables)

Agriculture and Water Resources

H-4. How does the water cycle interact with other Earth system processes to change the predictability and impacts of hazardous events and hazard chains (1 observable)

Algal Bloom and Water Quality Mapping

Climate

C-3. How large are the variations in the global carbon cycle? (1 observable)

Urban Heat and Health

Fire Ecology and Risk

Weather

W-3. How do spatial variations in surface characteristics modify transfer between domains? (1 observable)

Fire Ecology and Risk

EARTH FLEET

ECOsysteM Spaceborne Thermal Radiometer Experiment on Space Station

ECOSTRESS is addressing 3 science questions:

1. How is the biosphere responding to changes in water availability?
2. How do changes in vegetation water stress impact the global carbon cycle?
3. Can agricultural vulnerability be reduced through advanced monitoring of agricultural water consumptive use and improved drought estimation?

Integrating Imaging Spectroscopy and Earth System Modeling

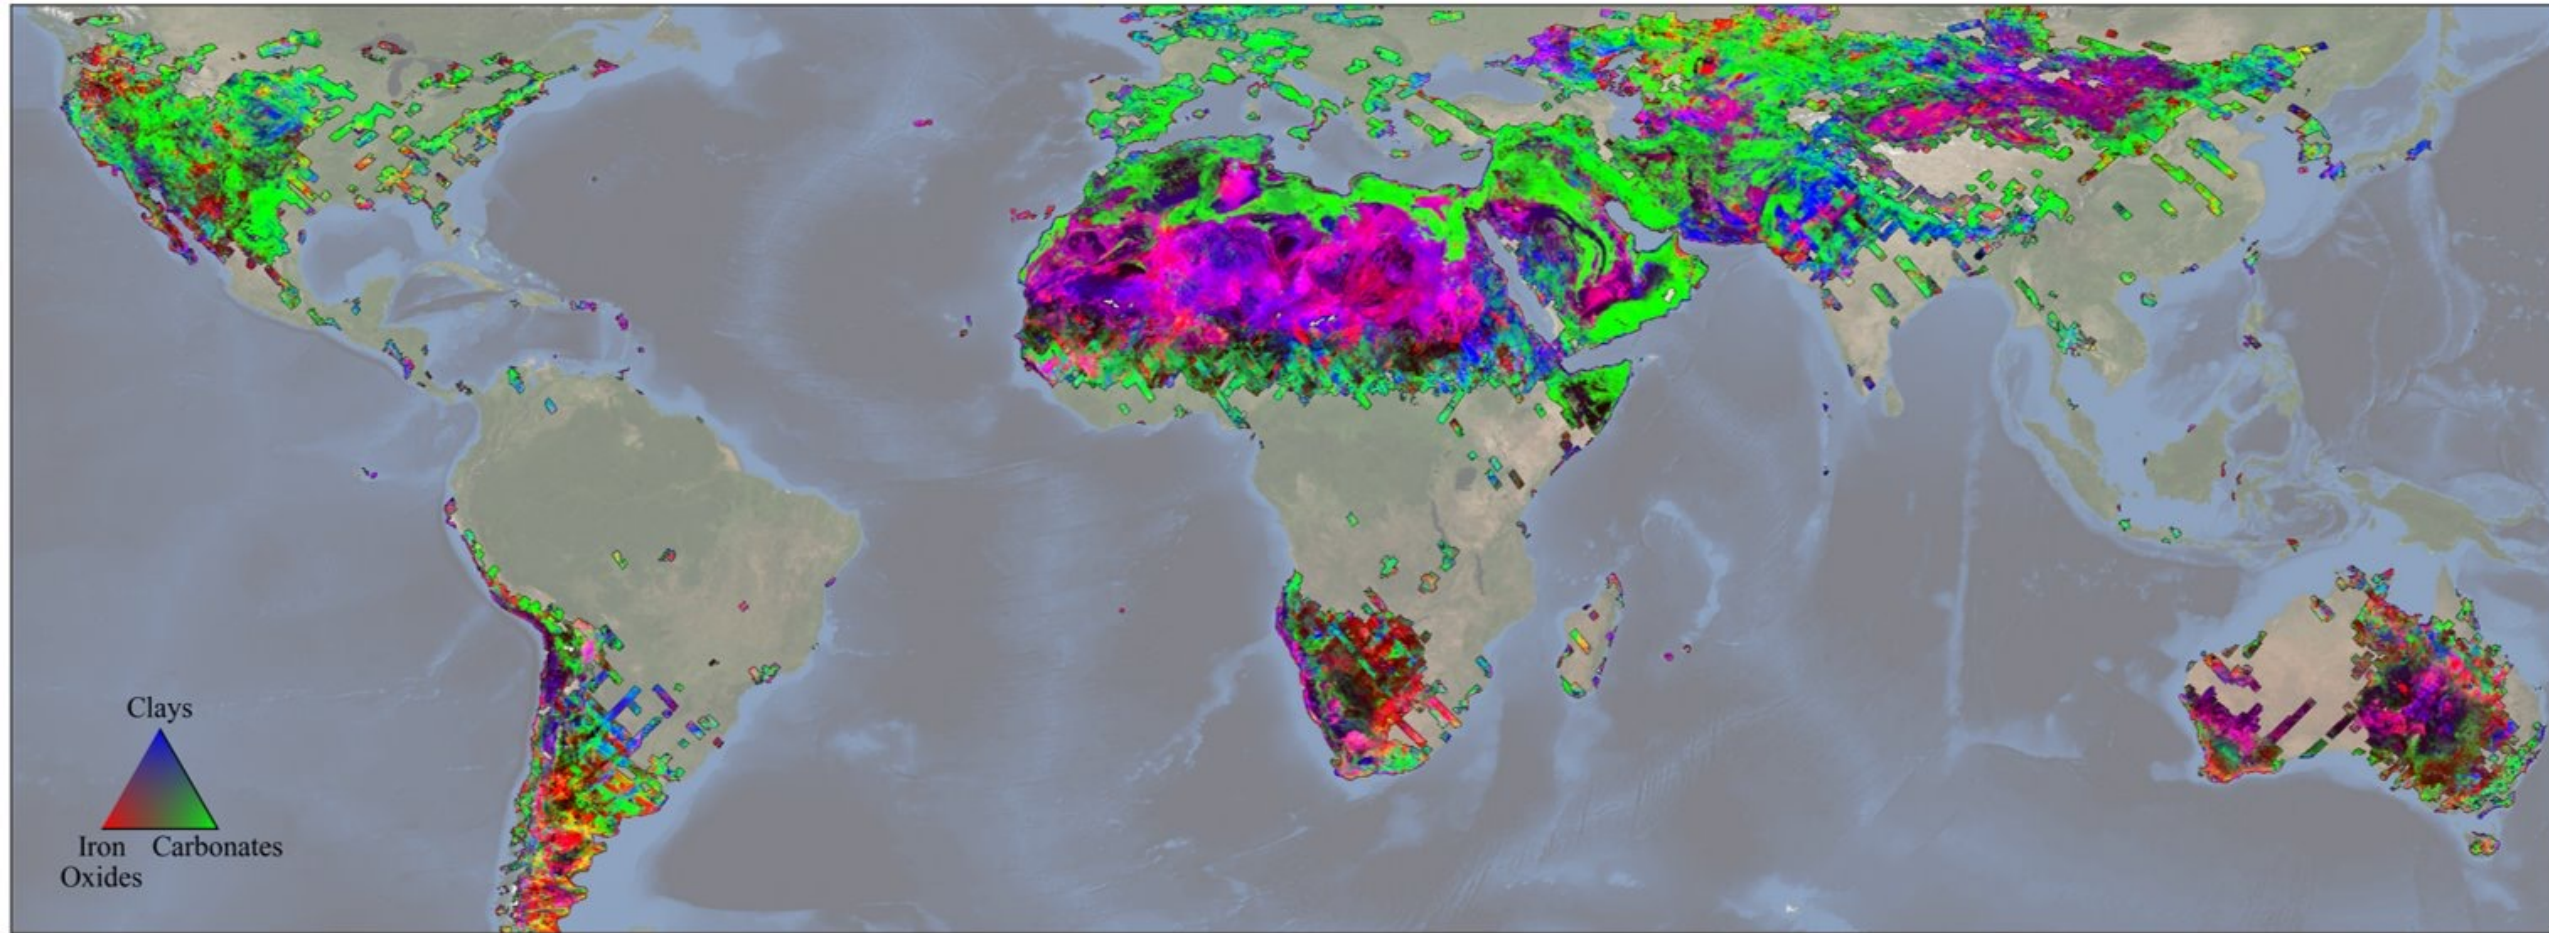

1) Constrain the sign and magnitude of dust-related radiative forcing at regional and global scales by **acquiring, validating and delivering updates of surface mineralogy** used to initialize Earth System Models.

2) Predict the increase or decrease of available dust sources under future climate scenarios by **initializing Earth System Model forecast models with the mineralogy** of soils exposed within at-risk lands bordering arid dust source regions.

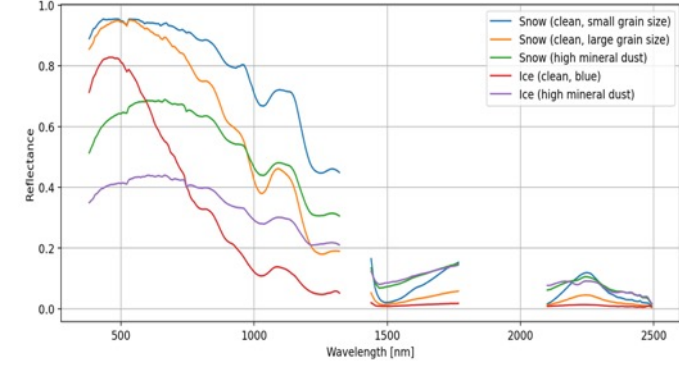

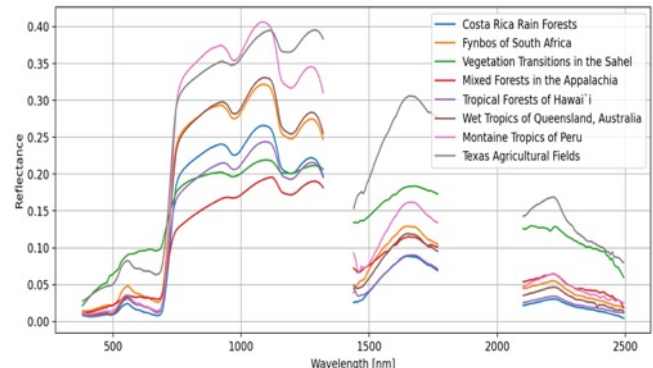

EMIT: Global Mineral Mapping

EMIT: Collecting Spectra Across the Planet

EMIT: Extent of data collection is growing

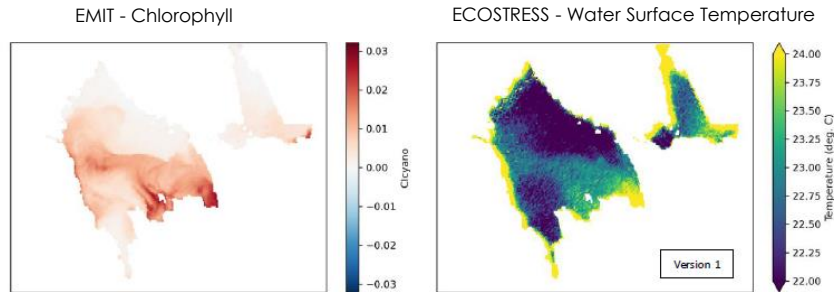

Example VSWIR + TIR Science and Applications

Aquatic Ecosystems – Harmful Algal Blooms

SBG VSWIR + TIR are critical to understanding environmental controls (e.g., marine heat waves) on harmful algal blooms for public health management

San Luis Reservoir, California Example – August 14, 2022

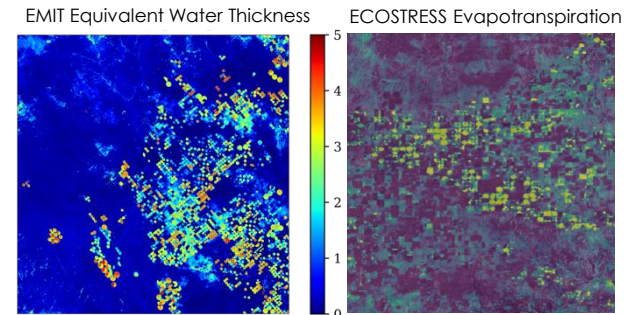

Credit: K. Luis

Terrestrial Ecosystems - Agriculture

SBG VSWIR + TIR will provide critical information on vegetation water stress and water availability to guide agricultural water consumptive use and improve drought estimation

Texas Example – August 2022

Credit: N. Bohn

Santa Barbara – Spring 2022

SHIFT AVIRIS-NG acquisition: 5m ECOSTRESS acquisition: 70m

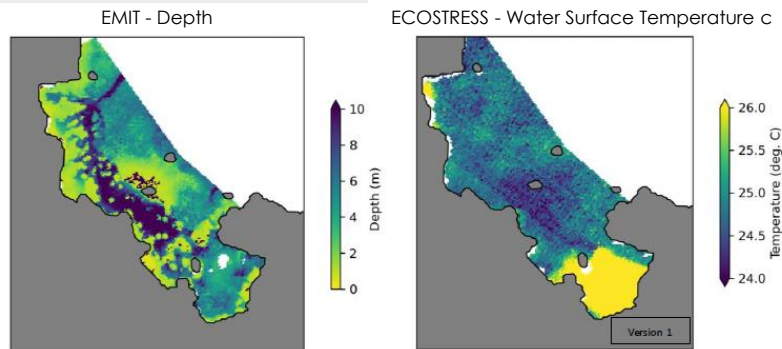

Credit: C. Wong

Aquatic Ecosystems – Coral

SBG VSWIR + TIR are critical to understanding the composition and condition of benthic habitats

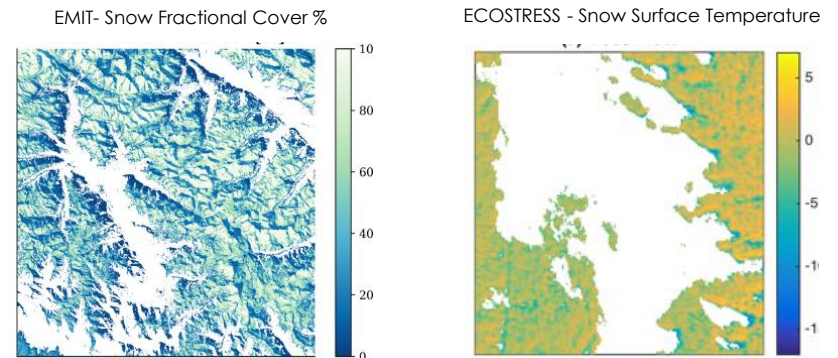

Kāneʻohe Bay, Hawaiʻi Example – March 25, 2023

Credit: K. Luis

Hydrology & Water Resources – Snow

SBG VSWIR + TIR are critical to understanding and quantifying snowmelt and ice worldwide driven by topographic variability.

Space Station Synergies: Applying ECOSTRESS and EMIT to ecological problems for Scientific Insight

The International Space Station is a critical asset for the Earth science community – both for advancing critical science and applications priorities, and as a platform for technology demonstrations/pathfinders. These benefits have been particularly significant in recent years, with the installation and operation of instruments such as ECOSTRESS, a multispectral thermal instrument, and EMIT, a visible to short wave infrared imaging spectrometer with best-in-class signal to noise - both acquiring data at field-scale (<70-m). With both sensors mounted on the ISS, there is an unprecedented opportunity to demonstrate the compounded benefits of working with both datasets. In this workshop we highlight the power of these tools when used together, through the use of open source tools and services, cloud compute resources to effectively combine data
