nswenson@nd.edu

Expanding the Bounds of Spectral Functional Biology

Can richer and more dynamic assays of plant function be linked to spectral data?

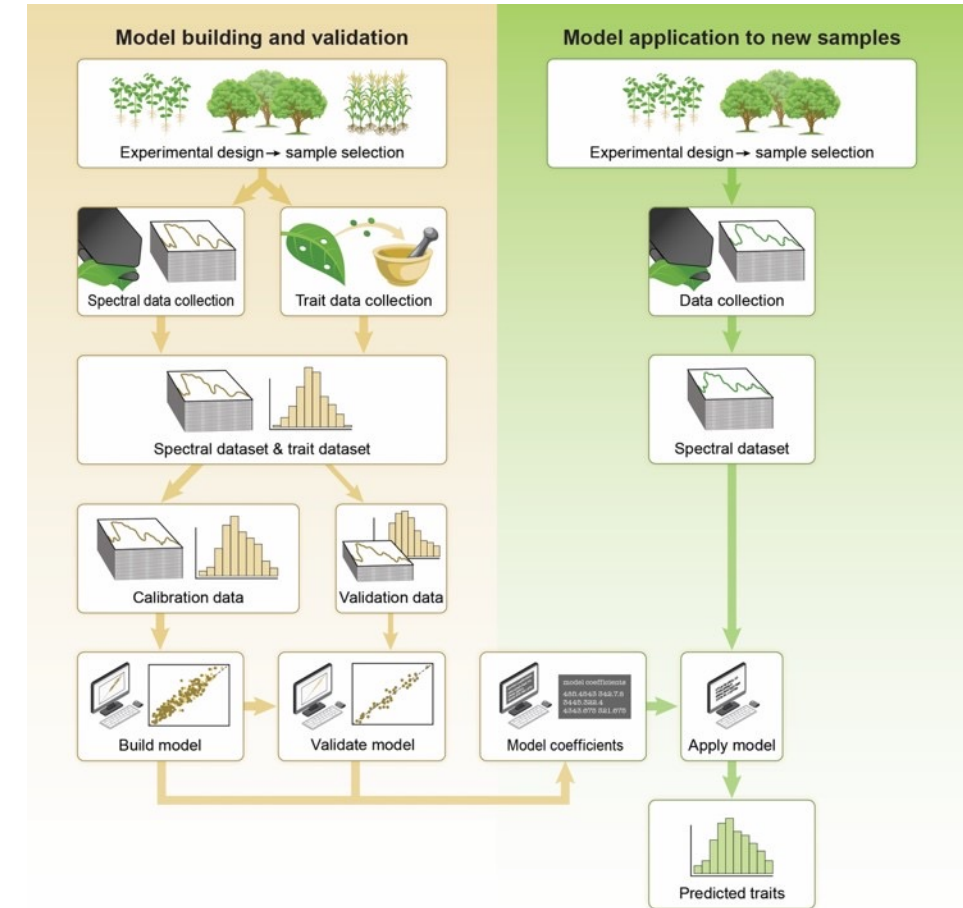

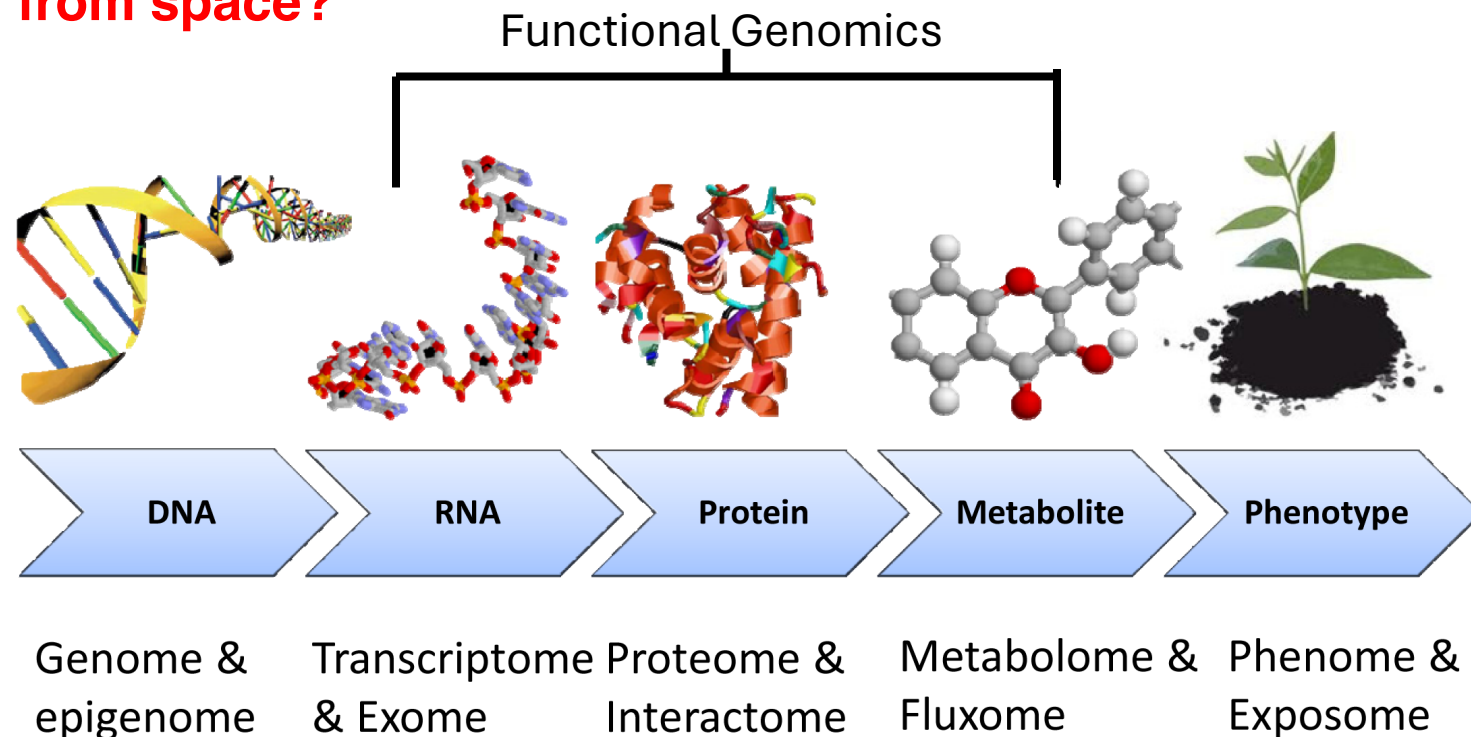

Phenome & Exposome

Expanding the Bounds of Spectral Functional Biology

Can we predict the expression of thousands of functions?

Can we study transcriptomics from space?

Objectives

Establish the relationships between drought, spectral signatures and gene expression in the greenhouse

Prediction of gene expression for sub-plots in the two forest dynamics plots throughout the growing season.

Field validation of predictions by collecting spectral and gene expression data from individuals in the sub-plots throughout the growing season in 2 years.

Objectives

Greenhouse Study

Completed in Summer of 2023

15 focal species

Control & Drought Samples

Physiologically Monitored

Spectral Reflectance via an ASD

RNAseq (beginning)

Study Sites

Study Sites – Left) The location of the Wabikon Lake (Yellow Dot) and UNDERC (Blue Dot) Forest Dynamics Plots. **Right)** A diagram of the data layers collected in a typical forest dynamics plot – topography and the distribution and diameter of every individual tree with a diameter 1cm or greater. Plots are re-censused every years in order to track changes in species distributions and diversity and individual growth and mortality.

Field Collection 2023

- 2 sites (UNDERC & Wabikon)
 - 15 plots/site
 - 9 trees/plot
 - 2 sampling periods
 - 135 samples/site/period
 - 2 years (2023 & 2024)
-
- 540 samples collected in 2023
 - Leaf spectral reflectance via ASD
 - Leaf traits
 - RNAseq (ongoing)

Lab & Informatics Work

© Infographics - 211

Qiagen RNA extraction via QiaCube
Illumina RiboZero+ custom kits

Illumina HiSeq X (2x150bp ; ~6Gb)

- Work completed on **40 individuals** so far (sugar maple)
- **~35k genes** per sample
- Mapped to published genome
- **Expression** of each gene characterized
- Functionally **Annotated**

- Today I will show results from Regularized Canonical Correlation Analysis (**RCC**) – common in ‘multi-omic’ analyses.

Gene expression for 1k random genes in Sugar Maple by Spectral Reflectance (RCC – regularized canonical correlation analysis)

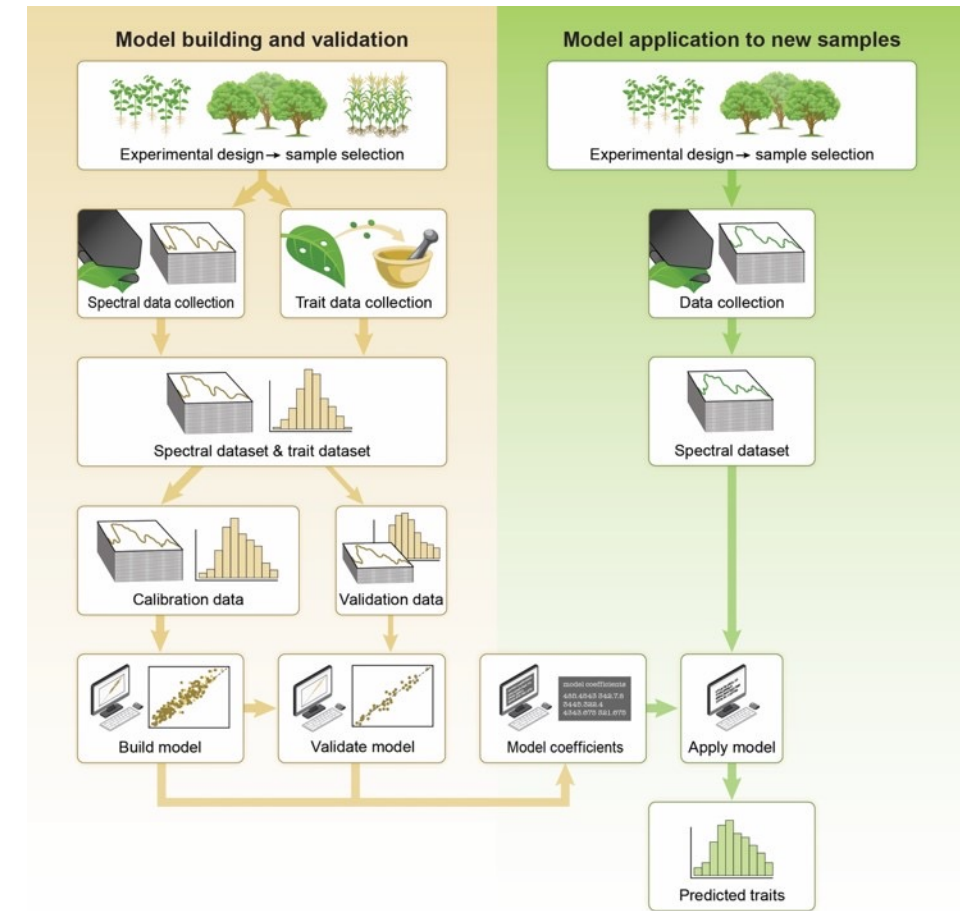

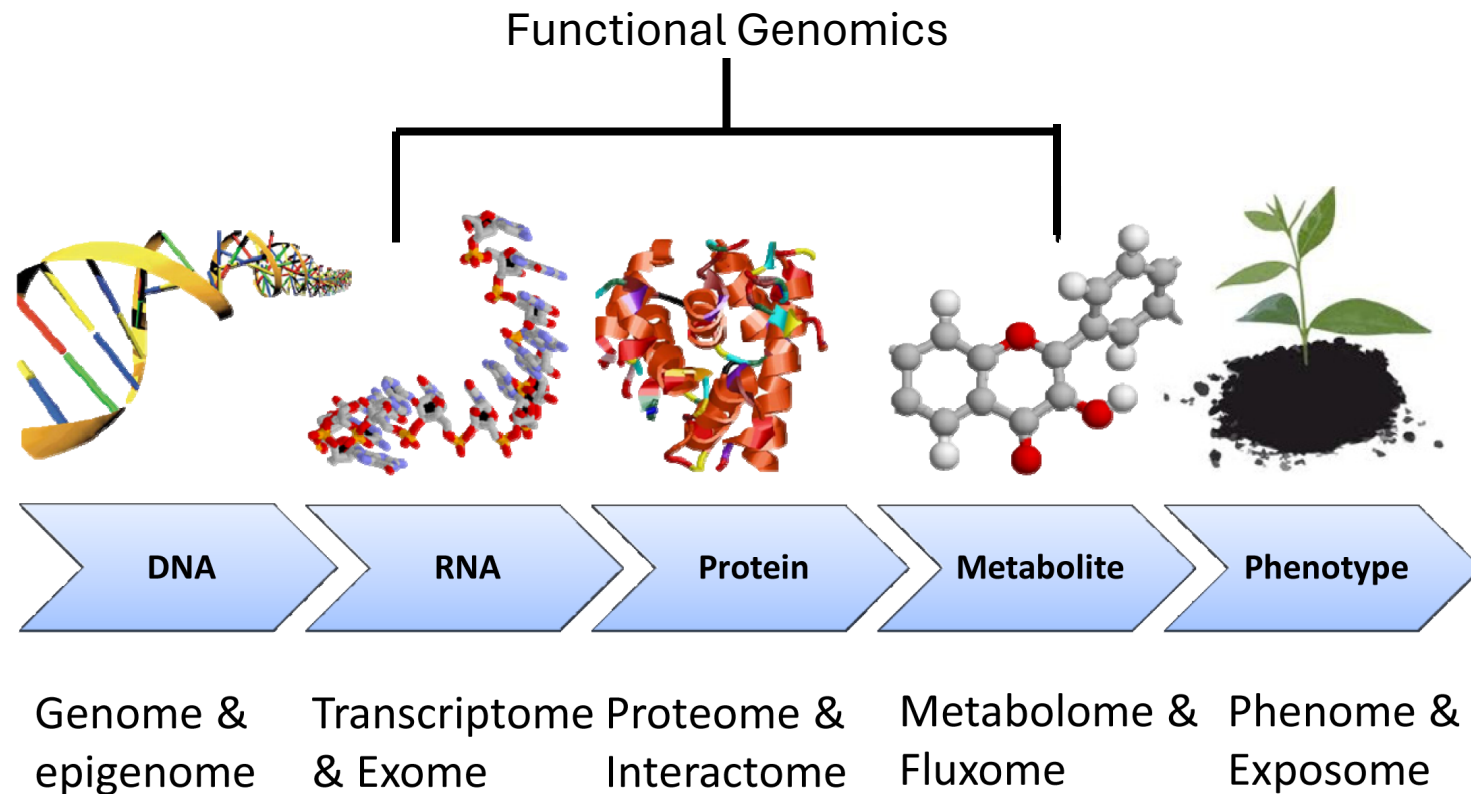

RCC of gene expression (ABA response genes) by spectral reflectance (n = 44 genes)

RCC of gene expression (drought response genes) by spectral reflectance (n = 9 genes)

Expanding the Bounds of Spectral Functional Biology

Untargeted Metabolomics – Leaf-Level Metabolite Expression by Spectral Reflectance (~5k metabolites)

Conclusions and What's Next

- Levels of **gene and metabolite expression can be predicted upon the basis of spectral reflectance data**, but this, of course, is not the case for all genes or metabolites.
- We are **developing the informatics pipelines** to move from one species to many such that we can link spectral data to genes and metabolites that are shared between species
- We have **completed ~60% of the sampling** for this project with one more field campaign this summer (coinciding with NEON AOP at both sites)
- We aim to provide the **first maps of gene expression on landscape scales by the end of 2024.**
